

Java assignment

F.M. = 10

1. Write a Java program to realise inheritance. Consider a class Fish which has member variables to characterise the general fish class, like length, colour, scale type of a fish. The Fish class has a method display() which prints the general features of a fish. Another class Shark inherits this Fish class and overloads the method display() to display its name and unique feature of it. Run your program and show the output.
